

REDE-108: Restorative Operative

This course is the introductory presentation of Operative Dentistry. The student will learn about the anatomy and occlusal schemes of teeth, their development and histologic considerations in treatment planning care of the dentition. Students will learn about the carious process and manners in which teeth can become damaged due to disease and trauma and will learn the indications and methods of treatment. This course will prepare the students for the clinical phase of operative care.
